

Agentic AI Immersion Workshop

Pre-Requisites Checklist — Complete Before Day 1

Every lab authenticates against a live Microsoft Foundry project with your own Azure identity — no shared tenants, no API keys. Work through this checklist before Day 1 so class time is spent building agents, not troubleshooting environments.

SETUP TIME	DELIVERY	DEADLINE
45–60 minutes Plus 5–15 min role propagation	Dev Container or local install VS Code required either way	1 business day before class RBAC roles need time to propagate

WHY THIS MATTERS

This workshop is hands-on from the first notebook — there's no lecture-only warm-up period. If your Azure identity, Foundry project, or local tools aren't ready, the first lab (and the RBAC propagation delay behind it) can eat 20–30 minutes of class time you won't get back.

CHOOSE YOUR SETUP PATH

OPTION A — RECOMMENDED Dev Container Install Docker Desktop + VS Code with the Dev Containers extension, clone the repo, then F1 → Dev Containers: Reopen in Container . Python, pinned packages, Azure CLI, azd, and Jupyter are pre-installed for you.	OPTION B Local Setup Install the tools in the checklist below yourself, then run <code>pip install -r requirements.txt</code> inside a virtual environment.
---	---

REQUIRED TOOLS & ACCOUNTS

Requirement	Details
Visual Studio Code	Latest version, with the Python, Jupyter, and GitHub Copilot extensions installed.
Git & GitHub account	Git installed and signed in (git config / credential manager). Needed to clone the repo and use GitHub Copilot — test with a <code>git clone</code> before Day 1.
Python 3.12+ (3.14 recommended)	Matches the pinned dependency lock used by the Dev Container. Confirm with <code>python --version</code> .
Azure CLI	Installed and signed in via <code>az login</code> . Confirm the subscription with <code>az account show</code> .
Azure subscription access	Access to create/use a Microsoft Foundry resource. Contributor is easiest; otherwise request the RBAC roles on page 2 from your Azure admin in advance.
Docker Desktop	Needed for the Dev Container path, and for a local Redis container used by one Agent Framework lab (threads/2).

DELIVERY READINESS

Readiness, Permissions & Optional Modules

FOUNDRY PROJECT & MODEL DEPLOYMENTS

Every notebook authenticates with `DefaultAzureCredential` — **no API keys**. Before Day 1:

- Create a Foundry resource at `ai.azure.com` → **Create project** (region such as East US 2 recommended for model availability).
- Deploy `gpt-5.4`, `gpt-5.4-mini`, `gpt-5.4-nano`, and `text-embedding-3-large` under **Models + endpoints**; wait for status *Succeeded*.
- Add **Azure AI Search** and **Application Insights** connections under **Connections**.
- Copy `.env.example` to `.env` and fill in your endpoint, model names, and search endpoint.

REQUIRED AZURE PERMISSIONS (RBAC)

Ask your Azure admin to assign these **data-plane roles** before Day 1 (allow 5–15 minutes to propagate). `scripts/setup-permissions.ps1` assigns all of them automatically if you have sufficient rights.

Role	Scope
Foundry User	Foundry account
Cognitive Services OpenAI User	Foundry account
Storage Blob Data Contributor	Project storage account
Search Index Data Contributor	Azure AI Search resource
Search Index Data Reader	Azure AI Search resource
Search Service Contributor	Azure AI Search resource

Note: the Foundry project's managed identity and the AI Search managed identity also need matching roles for evaluation and Foundry IQ labs — the setup script covers this automatically.

VERIFY YOUR SETUP

- `pip install -r requirements.txt` completes without errors.
- `az account show` returns the subscription with your Foundry project.
- The README's `AIProjectClient` verification snippet prints **“Connected to Foundry.”**
- `azure-ai-agents/1-basics.ipynb` runs cleanly in VS Code. A 401/403 means roles are still propagating — wait and retry.

OPTIONAL — ADDITIONAL MODULES

Not required for Day 1 — set up only if your agenda includes these sessions.

Hosted Agents (notebook 10, hosted-agents/, AgentOps/)

Azure Developer CLI (azd) installed; permission to deploy Foundry hosted-agent containers.

Observability & Evaluations

(observability-and-evaluations/)

Application Insights connection on the project; public network access (or reachable private endpoints) on project storage.

Agent Framework threads lab (threads/2)

Local Redis: `docker run -d --name redis-workshop -p 6379:6379 redis:7-alpine`.

Model Router lab (13-model-router.ipynb)

The `gpt-5.4-mini` and `gpt-5.4-nano` deployments; the lab skips any tier that isn't deployed.

AgentOps (GitOps CI/CD demo) (AgentOps/)

A GitHub repo with Actions enabled, plus rights to configure Azure federated credentials for CI/CD.

NEED HELP BEFORE DAY 1

If you can't assign yourself the RBAC roles above, or your subscription/tenant is locked down, share page 2 of this datasheet with your Azure administrator now — role propagation alone can take up to 15 minutes, so don't wait until the morning of the workshop. Questions about scope or access: open a GitHub issue on the repository.

INCLUDED VS. OUT OF SCOPE FOR SETUP

YOU HANDLE

- VS Code, Git, Python, Azure CLI installed
- Foundry project created + models deployed
- RBAC roles assigned (self-service or via admin)
- `.env` file populated from `.env.example`

NOT NEEDED FOR DAY 1

- Azure Developer CLI (azd) — hosted agents only
- Application Insights wiring — observability only
- Local Redis — one Agent Framework lab only
- GitHub Actions / federated creds — AgentOps demo only
